

Three views of a node

DECISION FLOW scope: whole repository

Where does this codebase branch?

The always-visible map. Static analysis finds every fork in the code; an LLM judges which of them a person would genuinely reason about, and writes the question each one asks. Entry points are green, decisions amber, outcomes and effects follow the arms out. Nothing is deleted to make the page fit — detail is demoted a level and reached through the + control.

Two decisions revealed beneath the **Generate open tickets by queue feed** entry. Every node carries its own provenance — **user.py:56**, **feeds.py:169**, **staff.py:1531** — so any claim the diagram makes can be checked against the source. Dashed containers show what a single + revealed.

One decision in a Django codebase, shown at three depths — the map that locates it, the control flow that explains it, and the source that proves it.

FLOWCHART scope: one class

How does that decision execute?

Choosing **isolate** turns the node into a frame: the symbol on the left, the control flow of the selected method on the right.

Filter by queue slugs? resolves to class **Command** in **escalate_tickets.py:54**. The chart traces **handle** through both guards — *queue slugs specified?* and *verbose mode enabled?* — with Yes/No arms rejoining before the per-queue loop.

CODE VIEW scope: one method

And what does the source say?

The same frame, toggled. The left column is unchanged — only the right swaps between diagram and code.

handle as written. Lines 10–11 and 13–14 are the two guards drawn as diamonds alongside; the loop at line 16 is the *for each queue* node. Source is fetched on demand and cached, never generated ahead of time.
